

Scott Laufer

Programming Assignment #2

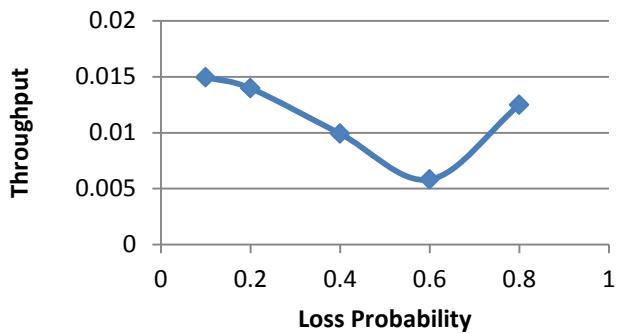

CSE 489, Spring 2014

## Analysis

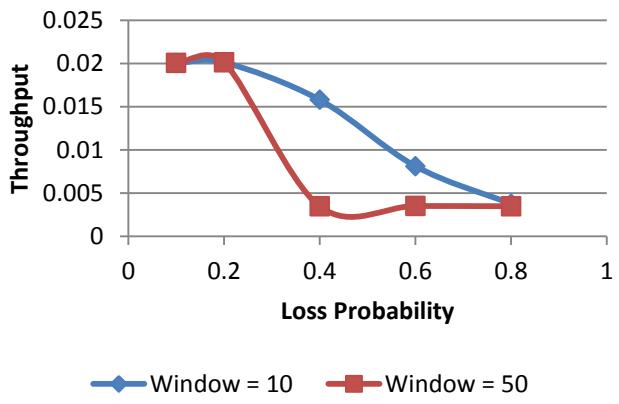

Analysis of the protocols after implementation produced mostly predictable results. A few quirks were found:

- Throughput of Alternating Bit increases between loss probability 0.6 and 0.8. This is probably due to messages being dropped when the sender is not ready (i.e. hasn't received an ACK yet)
- Go-Back-N performance seems to drop off more steeply with larger window sizes. This is expected, as a larger window size means more data has to be resent with each lost or corrupted packet.
- Selective repeat is almost totally unaffected by window size. Very slight throughput gains were made with larger window sizes at low loss probabilities.

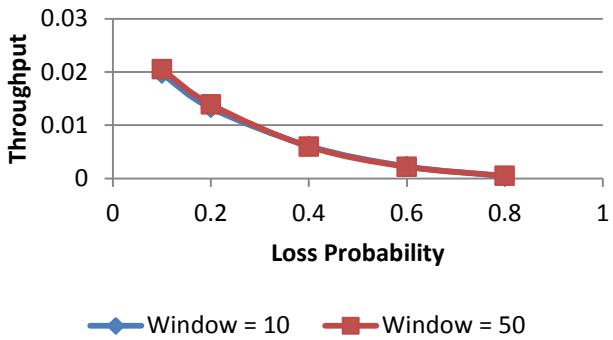

## Experiment 1: Alternating Bit

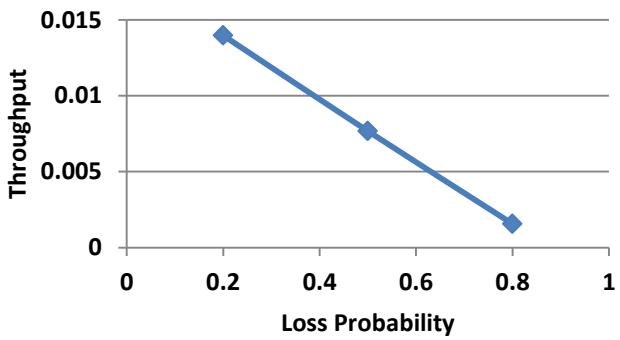

## Experiment 1: Go-Back-N

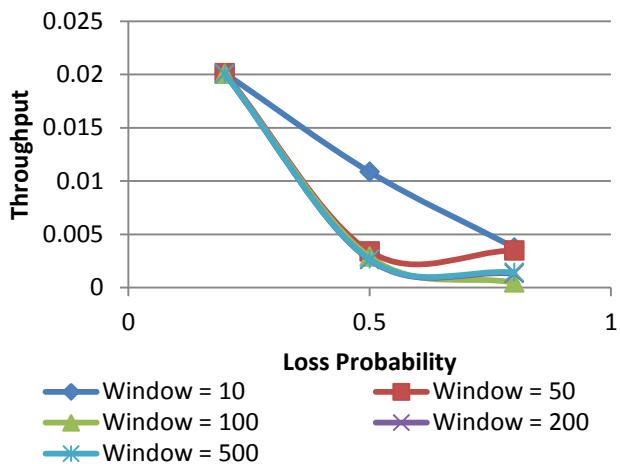

## Experiment 1: Selective Repeat

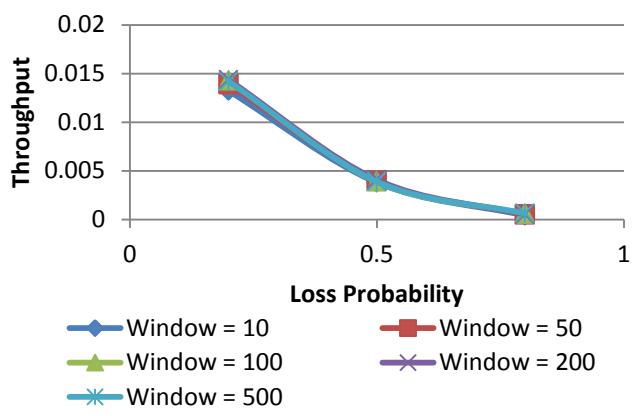

## Experiment 2: Alternating Bit

## Experiment 2: Go-Back-N

## Experiment 2: Selective Repeat
